**NOTICE TO
FLOOD INSURANCE STUDY USERS**

Communities participating in the National Flood Insurance Program have established repositories of flood hazard data for floodplain management and flood insurance purposes. This Flood Insurance Study may not contain all data available within the repository. It is advisable to contact the community repository for any additional data.

This publication incorporates revisions to the original Flood Insurance Study. These revisions are presented in Section 10.0.

Part or all of this FIS may be revised and republished at any time. In addition, part of this FIS may be revised by the Letter of Map Revision process, which does not involve republication or redistribution of the FIS. It is, therefore, the responsibility of the user to consult with community officials and to check the community repository to obtain the most current FIS components.

Initial Countywide FIS Effective Date: September 4, 1991

First Revised Countywide FIS Revision Date: January 19, 1996

Second Revised Countywide FIS Revision Date: December 19, 1997

Third Countywide FIS Revision Date: June 2, 2009

Fourth Revised Countywide FIS Revision Date: _____

FLOOD INSURANCE STUDY COLLIN COUNTY, TEXAS AND INCORPORATED AREAS

1.0 INTRODUCTION

1.1 Purpose of Study

This countywide Flood Insurance Study (FIS) investigates the existence and severity of flood hazards in, or revises and updates previous FIS and Flood Insurance Rate Maps (FIRMs) for the geographic area of Collin County, Texas, including: the Cities of Allen, Anna, Carrollton, Celina, Dallas, Farmersville, Frisco, Garland, Josephine, Lowry Crossing, Lucas, McKinney, Melissa, Murphy, Nevada, New Hope, Parker, Plano, Princeton, Richardson, Royse City, Sachse, Weston, and Wylie; and the Towns of Blue Ridge, Fairview, Lavon, Prosper, St. Paul, Van Alstyne, and Westminster, and the Unincorporated areas of Collin County; (hereinafter referred to collectively as Collin County).

Please note that the City of Carrollton is geographically located in Collin, Dallas and Denton Counties; the City of Dallas is geographically located in Collin, Dallas, Denton and Rockwall Counties; the Cities of Frisco and Plano are geographically located in Collin and Denton Counties; the Cities of Garland, Richardson, Sachse, and Wylie are geographically located in Collin and Dallas Counties; the City of Josephine is geographically located in Collin and Hunt Counties. The City of Royse City is geographically located in Collin and Rockwall Counties. The Town of Van Alstyne is geographically located in Collin and Grayson Counties. Only the portions within Collin County for these communities are included in this FIS. The remaining portions of these communities are being shown in each adjacent County FIS.

Please note that on the effective date of this study, the City of Carrollton has no Special Flood Hazard Areas (SFHAs) within Collin County. This does not preclude future determinations of SFHAs that could be necessitated by changed conditions affecting the community (i.e. annexation of new lands) or the availability of new scientific or technical data about flood hazards.

This FIS aids in the administration of the National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973. This FIS has developed flood risk data for various areas of the county that will be used to establish actuarial flood insurance rates. This information will also be used by Collin County to update existing floodplain regulations as part of the Regular Phase of the National Flood Insurance Program (NFIP), and will also be used by local and regional planners to further promote sound land use and floodplain development. Minimum floodplain management requirements for participation in the NFIP are set forth in the Code of Federal Regulations at 44 CFR, 60.3.

In some states or communities, floodplain management criteria or regulations may exist that are more restrictive or comprehensive than the minimum Federal requirements. In such cases, the more restrictive criteria take precedence and the state (or other jurisdictional agency) will be able to explain them.

1.2 Authority and Acknowledgments

The sources of authority for this FIS are the National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973.

This FIS was prepared to include the unincorporated areas and incorporated communities within Collin County into a countywide FIS. Information on the authority and acknowledgments for each of these studies, compiled from their previous effective narratives, is shown below.

Unincorporated Areas of Collin County:

the hydrologic and hydraulic analyses for the FIS dated September 16, 1980 (FIRM dated March 16, 1981) were prepared by Freese and Nichols, Inc./Rady and Associates, Inc., for the Federal Emergency Management Agency (FEMA), under Contract No. H-4570. This work was completed in April 1979.

City of Allen:

the hydrologic and hydraulic analyses for the FIS dated December 1977 (FIRM dated June 1, 1978) were prepared by the Fort Worth District of the U. S. Army Corps of Engineers (USACE), for FEMA, under Inter-Agency Agreement Nos. H-7-76 and H10-77, Project Order Nos. 21 and 2. This work was completed in March 1977.

City of Celina:

the hydrologic and hydraulic analyses for the FIS dated May 1979 (FIRM dated November 1, 1979) were prepared by Freese and Nichols, Inc./Rady and Associates, Inc., for FEMA, under Contract No. H4570. This work was completed in April 1978.

City of Fairview:

the hydrologic and hydraulic analyses for the FIS dated May 1979 (FIRM dated November 1, 1979) were prepared by Freese and Nichols, Inc./Rady and Associates, Inc., for FEMA, under Contract No. H4570. This work was completed in April 1978.

City of Frisco:

the hydrologic and hydraulic analyses for the FIS dated December 1979 (FIRM dated June 18, 1980) were prepared by Freese and Nichols, Inc./Rady and Associates, Inc., for FEMA, under Contract No. H4570. This work was completed in June 1978.

City of Josephine:	the hydrologic and hydraulic analyses for the FIS dated July 1979 (FIRM dated January 2, 1980) were prepared by Freese and Nichols, Inc./Rady and Associates, Inc., for FEMA, under Contract No. H4570. This work was completed in May 1978.
City of McKinney:	the hydrologic and hydraulic analyses for the FIS dated December 1979 (FIRM dated June 18, 1980) were prepared by Freese and Nichols, Inc./Rady and Associates, Inc., for FEMA, under Contract No. H4570. This work was completed in May 1978.
	the hydrologic analysis for Herndon Branch was developed as a result of a Letter of Map Revision issued October 13, 1994.
City of Murphy:	the hydrologic and hydraulic analyses for the FIS dated October 1979 (FIRM dated April 1, 1980) were prepared by USACE, for FEMA, under Inter-Agency Agreement No. H-10-77, Project Order No. 29. This work was completed in February 1978.
	The lower reach of Maxwell Creek downstream of McWhirter Road has been revised as the result of revised hydrology and the use of updated cross sections. The hydrologic and hydraulic analyses for this study were performed by the USACE, Fort Worth District, for FEMA, under Inter-Agency Agreement No. EMW-94-E-4371, Project Order No. 4. This work was completed in September 1995.
City of Parker:	the hydrologic and hydraulic analyses for the FIS dated February 1979 (FIRM dated August 15, 1979) were prepared by USACE for FEMA, under Inter-Agency Agreement No. H-10-77, Project Order No. 29. This work was completed in February 1978.
City of Plano:	the hydrologic and hydraulic analyses for the FIS dated January 2, 1980, were prepared by the USACE for FEMA, under Inter-Agency Agreement No. IAA-H-7-76, Project Order No. 21, and Inter-Agency Agreement no. IAA-H-10-77, Project Order No. 2.

City of Plano (Cont'd):

The hydrologic and hydraulic analyses for the revised FIS dated August 4, 1985, for Stream 5B13 and Stream 219 were prepared by Shimek, Jacobs, and Finklea; for Prairie Creek, the revised hydrologic and hydraulic analyses were prepared by Albert Halff Associates.

The hydrologic and hydraulic analyses for the revised FIS dated February 19, 1986, for Pittman Creek and North Fork Pittman Creek were prepared by Shimek, Jacobs, and Finklea. That work was completed in June 1984.

In the revised FIS dated August 19, 1987, the hydraulic analysis for Rowlett Creek was prepared by Espey, Huston and Associates, Inc., and completed in August 1985; the hydraulic analysis for Spring Creek was prepared by Shimek, Jacobs, and Finklea and completed in August 1985; the hydraulic analysis for Prairie Creek was prepared by Nathan D. Maier Consulting Engineers, Inc., for Worrell & Associates, Inc. and completed in March 1986; the hydraulic analysis from a Letter of Map Revision for Stream 5B23 issued November 26, 1986 was prepared by Shimek, Jacobs, and Finklea and completed in August 1985; and the hydraulic analysis for Stream 5B234 was prepared by HuittZollars, Inc. and completed in February 1986.

In the revised FIS dated December 19, 1997, the hydraulic analyses for Bowman Branch, Brown Branch, Rowlett Creek, Russell Creek, Spring Creek, Stream IC-1, Stream IC-1A, Stream 5B27, Stream 5B29 through 5B37, and White Rock Creek were prepared by the USACE for FEMA under Inter-Agency Agreement EMW-85-E-1922 and completed in April 1997. White Rock Creek was revised in June 1998 to include updated topographic data; the hydraulic analysis prepared by Albert H. Halff Associates, Inc for streams 5B18 through 5B26 and stream 5B28 was completed in June 1989. The hydrologic and hydraulic analyses for Indian Creek were prepared by USACE during the preparation of the FIS for Denton County.

City of Wylie (Cont'd): under Contract No. H-4570. The work was completed in August 1978.

In the revised FIS dated March 2, 1989, the hydraulic analysis of Rush Creek was prepared by Nathan D. Maier, Inc., to reflect the effects of a channel modification and bridge construction project. That work was completed in July 1987.

As part of the 2009 countywide revision, hydrologic and hydraulic analyses for Cottonwood Creek No. 1, Doe Branch, East Fork Trinity River, Muddy Creek, Rowlett Creek, West Rowlett Creek, and Stewart Creek Tributary No. 4 were prepared by CF3R JV, for FEMA, under contract No. EMT-2002-CO-0049. This work was completed in September 2006. Base map information that was used for this study was provided in digital format by North Central Texas Council of Governments. This information was digitized at a scale of at least 1:12,000 from aerial photography dated 2003.

As part of this most recent countywide revision, hydrologic and hydraulic analyses for Caruth Creek, Cedar Creek West, Fox Creek, Pittman Creek, Pittman Creek Tributary 2, Prairie Creek, Russell Creek, Spring Creek, Spring Creek Tributary 4, Stream 2H3, Stream 5B18, Stream 5B19, Stream 5B20, Stream 5B21, Stream 5B22, Stream 5B23, Stream 5B24, Stream 5B25, Stream 5B26, Stream 5B27, Stream 5B29, Stream 5B30, Stream 5B31, Stream 5B32, Stream 5B33, Stream 5B34, Stream 5B35, Stream 5B36, Stream 5B37, Warden Creek, White Rock Creek, White Rock Creek Tributary 1, White Rock Creek Tributary 2, and White Rock Creek Tributary 3 were prepared as a Physical Map Revision (PMR) by Risk Assessment, Mapping, and Planning Partners (RAMPP), for FEMA, under contract No. HSFEHQ-09-D-0369. This work was completed in December 2011.

Base map information that was used for this countywide revision was derived from multiple sources. This information was compiled from the U.S. Geological Survey (USGS), 1989 and 1999, the National Geodetic Survey, 2004, the US Census Bureau, 2006 and 2009, Bureau of Land Management, 2006, FEMA existing FIRM data, 2009, and the North Central Texas Council of Governments (NCTCOG), 2007 and 2010.

The projection used in the preparation of the FIRMs was North American Datum of 1983 (NAD 83), Universal Transverse Mercator (UTM), Zone 14N in meters. The vertical datum was the North American Vertical Datum of 1988 (NAVD 88). Differences in datum, projection or State Plane zones used in the projection of the FIRMs for adjacent jurisdictions may result in slight positional differences across jurisdictional boundaries. These differences do not affect the accuracy of these FIRMs.

1.3 Coordination

The dates of the initial and final Consultation and Coordination Officer's (CCO) meetings held for Collin County and the incorporated communities within its boundaries for the previous FIS's are shown in the following tabulation.

<u>Community Name</u>	<u>Initial CCO Meeting</u>	<u>Final CCO Date</u>
Unincorporated Areas of Collin County	May 1978	March 10, 1980
Collin County and Incorporated Areas	May 5, 2004	February 15, 2007
City of Allen	January 28, 1986	August 18, 1988
City of Anna	*	*
City of Celina	August 17, 1977	December 5, 1978
City of Fairview	May 16, 1977	December 5, 1978
City of Farmersville	*	*
City of Frisco	May 20, 1977	May 8, 1979
Town of Lowry Crossing	*	*
City of Lucas	*	*
City of McKinney	September 1, 1977	April 6, 1979
City of Melissa	*	*
City of Murphy	July 8, 1977	October 23, 1978
City of Parker	July 8, 1977	September 11, 1978
City of Plano	September 11, 1984	*
City of Princeton	*	*
City of Weston	*	*
City of Wylie	May 17, 1977	May 9, 1979
Town of Blue Ridge	*	*
Town of Josephine	May 17, 1977	January 8, 1978
Town of Lavon	*	*
Town of Prosper	*	*
Town of St. Paul	*	*
Town of Westminster	*	*

*Data not applicable or not available

For this countywide revision, an initial CCO meeting was held on October 27, 2009, and was attended by representatives of the community, the study contractor, and FEMA. A final CCO meeting was held on _____, and attended by representatives of the community, the study contractor, and FEMA. All problems raised at that meeting have been addressed in this study.

2.0 AREA STUDIED

2.1 Scope of Study

This FIS covers the geographic area of Collin County, Texas.

Table 1, “Scope of Study,” lists the limits of study of all riverine flooding sources studied by detailed methods.

TABLE 1 – SCOPE OF STUDY

<u>Stream</u>	<u>Limits of Detailed Study</u>
Beck Branch	From its confluence with Rowlett Creek to a point approximately 70 feet upstream of Shiloh Road
Bois D’Arc Creek	From a point approximately 920 feet downstream of the county boundary to a point approximately 60 feet upstream of Josephine Street
Bowman Branch	From its confluence with Brown Branch to Alma Drive
Brown Branch	From its confluence with Rowlett Creek to Alma Drive
Bunny Run North Tributary	From its confluence with Bunny Run South to point approximately 2,500 feet upstream
Bunny Run South Tributary	From its confluence with Maxwell Creek to a point approximately 4,600 feet upstream
Camp Creek	From a point approximately 0.45 mile downstream of State Route 205 to the county boundary
Caruth Creek	From its confluence with Spring Creek to its upstream limit at President George Bush Highway
Cedar Creek West	From a point immediately upstream of E Wilson Creek Parkway to a point immediately downstream of Josephine Street
Cottonwood Branch	From a point approximately 0.95 mile upstream of its mouth to a point approximately 50 feet upstream of Preston Road
Cottonwood Branch Tributary 4	From its confluence with Cottonwood Branch to a point approximately 2,700 feet upstream
Cottonwood Branch Tributary 5	From its confluence with Cottonwood Branch to a point approximately 800 feet upstream
Cottonwood Branch Tributary 6	From its confluence with Cottonwood Branch to a point approximately 1,070 feet upstream
Cottonwood Creek No. 1	From its confluence with Rowlett Creek to a point approximately 0.65 miles upstream of State Route 121

TABLE 1 – SCOPE OF STUDY (Cont'd)

<u>Stream</u>	<u>Limits of Detailed Study</u>
Cottonwood Creek No. 2	From the county boundary to a point approximately 1,000 feet upstream of Lookout Drive
Cottonwood Creek- East Fork	From the county boundary to a point approximately 0.73 miles upstream
Doe Branch	From County Road 94 to County Road 94
Dublin Creek	From its confluence with Cottonwood Creek No. 1 to a point approximately 0.52 miles upstream of Dublin Road
East Fork Trinity River	From a point approximately 2.3 miles downstream of Greenville Road to a point approximately 0.28 miles upstream of County Road 279
Fox Creek	From its confluence with Spring Creek to a point immediately downstream from Renner Road
Franklin Branch	From its confluence with Wilson Creek to a point approximately 1,200 feet upstream of U. S. Route 380 (Buckner Road)
Hall Branch	From a point approximately 1,900 feet downstream of Hilton Head Road to Frankford Road
Herndon Branch	Feet above limit of detailed study (limit of detailed study is located approximately 1,300 feet upstream of SCS FWRS 3D Flood Retarding Structure)
Jeans Creek	From its confluence with Wilson Creek to a point approximately 250 feet upstream of Rockhill Road
Long Branch	From a point approximately 360 feet upstream of State route 78 to a point approximately 0.51 miles upstream of the Atchison, Topeka and Santa Fe Railway
Maxwell Creek	From a point approximately 1.46 miles downstream of FM 544 to a point approximately 0.47 mile upstream of Elisa Lane; three tributaries to Maxwell Creek: Bunny Run South Tributary, Bunny Run North Tributary, and McMillan Tributary
McKamy Branch	From the county boundary to a point approximately 0.51 miles upstream of White Rock Road
McMillan Tributary	From its confluence with Maxwell Creek to a point approximately 2,000 feet upstream

TABLE 1 – SCOPE OF STUDY (Cont'd)

<u>Stream</u>	<u>Limits of Detailed Study</u>
Muddy Creek (Upper Reach)	From a point approximately 1,870 feet upstream of its mouth to Stinson Road
Muddy Creek Tributary	From a point approximately 2,030 feet upstream of its confluence with Muddy Creek (Upper Reach) to a point approximately 0.63 mile upstream of Martinez Lane
Muddy Creek Tributary 1	From its confluence with Muddy Creek (Upper Reach) to a point approximately 600 feet upstream of FM 544
Muddy Creek Tributary 2	From its confluence with Muddy Creek (Upper Reach) to a point approximately 1.3 miles upstream
Mustang Creek	From its confluence with Cottonwood Creek No. 1 to a point approximately 1,370 feet upstream of FM 2170 (Main Street)
North Branch Stewart Creek Tributary 1	From a point approximately 2,000 feet upstream of its confluence with Stewart Creek Tributary 1 to the Dallas North Tollway
North Fork Pittman Creek	From its confluence with Pittman Creek to a point approximately 1,900 feet upstream of Parker Road
Osage Branch	From the county boundary to Shady Lane
Panther Creek	From a point approximately 0.86 miles downstream of Burlington Northern Railroad to a point approximately 1.25 miles upstream of State Highway 289
Panther Creek Tributary 1	From its confluence with Spring Creek to a point approximately 1.4 miles upstream
Pittman Creek	From its confluence with Spring Creek to its upstream limit at a point approximately 450 feet upstream of Whiffletree Drive
Pittman Creek Tributary 2	From its confluence with Pittman Creek to its upstream limit approximately 1,200 feet upstream of Sandpiper Lane
Pond Branch	From a point at the county boundary to a point approximately 0.43 miles upstream of the county boundary
Prairie Creek	From its confluence with Spring Creek to a point approximately 0.58 miles upstream of Woodburn Corners Road

The areas studied by detailed methods were selected with priority given to all known flood hazard areas and areas of projected development and proposed construction.

Approximate analyses were applied to numerous streams in the county, including the remaining portions of selected flooding sources studied by detailed methods. Approximate analyses were used to study those areas having a low development potential or minimal flood hazards. The scope and methods of study were proposed to, and agreed upon by, FEMA and Collin County.

This FIS also incorporates, where applicable, the determinations of letters issued by FEMA resulting in map changes (Letter of Map Revision [LOMR], and Letter of Map Revision Based on Fill [LOMR-F]). Letters of Map Revision incorporated as part of this countywide update have been shown in Table 2C, Letters of Map Revision,” and are reflected in Table 5, “Floodway Data,” and Exhibit 1, “Flood Profiles.”

¹LOMR was partially incorporated.

With the incorporation of LOMR Case Number 10-06-0997P, the stream previously named Stream 2I11 was renamed Stream 2I12, and the stream previously named Stream 2I12 was renamed Stream 2I11.

Detail-studied streams that were not re-studied as part of this map update may include a profile baseline on the FIRM. The profile baselines for these streams were based on the best available data at the time of their study and are depicted as they were on the previous FIRMs. In some cases the transferred profile baseline may deviate significantly from the channel or may be outside of the floodplain.

2.2 Community Description

Collin County is located in northeastern Texas, approximately thirty miles south of the Red River. McKinney, the county seat, is thirty-four miles northeast of the City of Dallas. The county is bordered by the following counties: Grayson to the north, Fannin, to the northeast, Hunt to the east, Rockwall to the southeast, Dallas to the South, and Denton to the west. The county is approximately 841 square miles in size and had a population of 782,341 in 2010 (Reference 1). The economy of the county includes farming, ranching, and light industrial activity; and its agricultural crops include cotton, sorghum, wheat, and hay.

Collin County is drained primarily by the East Fork of the Trinity River (Lake Lavon) and its tributaries. The western edge of the county is drained by a few tributaries to the Elm Fork of the Trinity River; the eastern edge is drained by tributaries to Sabine Creek.

The topography of the county is primarily rolling prairie with elevations ranging from 450 to 700 feet above sea level. Deep clayey soils over marl and chalk surface the central and western part of the county. Dark loamy alluvial soils lie in the eastern section. The climate is moderate, with an average yearly rainfall of just under 35 inches (Reference 2).

2.3 Principal Flood Problems

The principal flood problems in Collin County occur along the East Fork Trinity River and Sister Grove Creek. Flooding along these two streams is widespread, rather than limited to isolated locations. Other flooding problems within the county are reportedly controlled by numerous Soil Conservation Service flood-control structures. Although major floods are rare, several large floods have occurred in the Rowlett Creek watershed, in May 1933, April 1942, May 1946, August 1947, June 1951, April 1957, July 1962, September 1964, April 1966, and March 1977. Historical flood information for the East Fork Trinity River near McKinney begins in 1913. Since that date, the highest stage occurred in April 1980 and 1982 when, according to US Geological Survey gages, a stage of 22.7 feet was reached. Major floods occurring since that time were in May 1990, June 1950, April 1957, September 1964, May 1958, September 1962, April 1966, and May 1969.

The USGS maintained a stream gauging station on the East Fork Trinity River at U. S. Route 380 (State Highway 24) from August 1942 to 1975 and currently maintains one near State Highway 5 since 1976.

In 1968, the USGS established a recording stream gage on Rowlett Creek at State Route 78 near Sachse, approximately 3.5 miles southeast of Plano. Historical information for that gage began with the flood of April 1942, which, estimated from high-water marks and backwater runs, had a peak discharge of approximately 60,000 cubic feet per second (cfs) and a recurrence interval of approximately 100 years. Drift observed in 1967 lodged on the Atchison, Topeka, and Santa Fe Railroad bridge located approximately 150 feet upstream of the gage indicated a discharge of approximately 50,000 cfs, probably in April 1966 or September 1964. The estimated recurrence interval for this flood would be approximately 50 years. No estimate of frequency was available for other historical floods on Rowlett Creek. The largest flood on White Rock Creek occurred in September 1964. This flood produced a peak discharge of 37,900 cfs at the USGS gage at Keller Springs Road, approximately three miles below Plano. This flood is estimated to have had a recurrence interval of approximately 500 years at the gage. Other large floods on White Rock Creek are known to have occurred in April 1942, June 1949, July 1962, April 1966, May 1969, and December 1971; however, no estimated of frequency is available for these floods.

2.4 Flood Protection Measures

There are several dams and reservoirs within Collin County that serve as flood protection structures. The largest of these is Lake Lavon, which is owned by the USACE. Lake Lavon is located on the East Fork Trinity River, and has a total storage capacity of approximately 921,200 acre-feet. There are numerous small dams throughout Collin County; of these, 103 are SCS structures.

3.0 **ENGINEERING METHODS**

For the flooding sources studied in detail in the county, standard hydrologic and hydraulic study methods were used to determine the flood hazard data required for this FIS. Flood events of a magnitude which are expected to be equaled or exceeded once on the average during any 10-, 50-, 100-, or 500-year period (recurrence interval) have been selected as having special significance for floodplain management and for flood insurance rates. These events, commonly termed the 10-, 50-, 100-, and 500-year floods, have a 10-, 2-, 1- and 0.2-percent annual chance, respectively, of being equaled or exceeded during any year. Although the recurrence interval represents the long term average period between floods of a specific magnitude, rare floods could occur at short intervals or even within the same year. The risk of experiencing a rare flood increases when periods greater than 1 year are considered. For example, the risk of having a flood which equals or exceeds the 100-year flood (1-percent chance of annual exceedence) in any 50-year period is approximately 40 percent (4 in 10), and, for any 90-year period, the risk increases to approximately 60 percent (6 in 10). The analyses reported herein reflect flooding potentials based on conditions existing in the county at the time of completion of this FIS. Maps and flood elevations will be amended periodically to reflect future changes.

3.1 Hydrologic Analyses

Hydrologic analyses were carried out to establish the peak discharge-frequency relationships for the flooding sources studied in detail affecting the county.

Initial Countywide and Previous Studies

Each incorporated community within, and the unincorporated areas of, Collin County has a previously printed FIS report. The hydrologic analyses described in those reports have been compiled and are summarized below

Flow frequencies for Beck Branch, Bowman Branch, Browns Branch, Cottonwood Creek No. 1 ([formerly Cottonwood Creek] downstream from the City of Allen), Indian Creek, McKamy Branch, Mustang Creek, North Fork Pittman Creek, Pittman Creek, Prairie Creek, Rowlett Creek downstream from the City of Allen, Rowlett Creek (downstream of U.S. Highway 75), Russell Creek, Spring Creek, Streams 2D8-2D12, Streams 2D15, 2D16, F1, 2G2, 2G3, 2G5, 2H3, 2I9, SI11, 2I12, 2L1, 5B13, 5B14, 5B18-5B37, IC-1, IC-1A, and SC-1, Tributary to Stream 5B13, and White Rock Creek (References 3, 21, and 22) were developed using the computer program NUDALLAS (Reference 4).

In those studies, the watersheds were divided into subbasins, and synthetic unit and flood hydrographs were developed for selected locations. National Weather Service (NWS) Technical Paper No. 40, National Oceanic and Atmospheric Administration (NOAA) Technical Memorandum NWS Hydro-35, and USACE Civil Engineer Bulletin No. EM 1110-2-1411 was used in developing the 10-, 2-, and 1-percent-annual-chance storms (References 5, 6, and 7). The 0.2-percent-annual-chance storm was based on extrapolated data. In 1968, the USGS established a recording stream gage on Rowlett Creek at State Route 78 in Garland. Historical flood information began with the flood of 1942, and a historical discharge-frequency curve was developed at the gage. Peak discharges computed at the gage for existing urbanization with the synthetic hydrograph and PULS routing procedures agree reasonably with those of the historic discharge-frequency curve.

For Cottonwood Branch, Doe Branch, Muddy Creek (downstream from Sanden Road), Muddy Creek Tributary, Muddy Creek Tributary 1, Rowlett Creek (upstream of State Highway 121), Rowlett Creek Tributary, Spring Creek (downstream of President George Bush Turnpike), Stewart Creek Tributary 1, Stewart Creek Tributary 2, Stewart Creek Tributary 3, Stewart Creek Tributary 4 (downstream of Fossil Ridge Drive), Rush Creek, and Rush Creek Tributary, Sabine Tributary B, Sloan Creek, and West Rowlett Creek (upstream of State Highway 121), (References 8, 12 and 25) regional flood frequency equations, developed by USGS, that related drainage basin characteristics to stream flow characteristics for the 10-, 2-, and 1-percent-annual-chance storms were used (Reference 9). The 0.2-percent-annual-chance storm peak discharge was obtained by extrapolating a straight line through the 10-, 2-, and 1-percent-annual-chance storms peak discharges plotted on log-probability paper.

Discharges for Stewart Creek (upstream of President George Bush Turnpike) were determined by regional flood frequency equations, developed by USGS, that related drainage basin characteristics to stream flow characteristics for the 10- and 2-percent-annual-chance storms were used (Reference 9). The 1-percent-annual-chance storm peak discharge was determined using the SCS TR-20 computer program (Reference 14). The 0.2-percent-annual-chance storm peak discharge was obtained by extrapolating a straight line through the 10-, 2-, and 1-percent-annual-chance storms peak discharges plotted on log-probability paper.

White Rock Creek discharges were obtained by defining drainage areas and using the HEC-1 computer program to compute runoff to and outflow from each of the lakes in the Plantation Resort stormwater retention system (Reference 15).

For East Fork Trinity River (downstream of County Road 331), Franklin Branch, Jeans Creek, Quail Creek Channel B, Unnamed Tributary to Wilson Creek and Wilson Creek peak discharge-frequency relationships were established using conventional unit hydrograph flood analyses and regionalized flood frequency equations. One-hour unit hydrographs were developed for selected locations on Wilson Creek and a six-hour unit hydrograph was developed for the East Fork Trinity River by the Fort Worth District of the USACE (Reference 16). Peak flood discharges for the East Fork Trinity River were compared with peak annual peak flow data at the USGS gauging station located at U. S. Route 380 and the East Fork Trinity River. The regional flood frequency equations, which relate drainage basin characteristics to stream flow characteristics for floods of the selected recurrence intervals, were adopted after evaluation of available regional frequency analyses (References 9 and 17). The 0.2-percent-annual-chance storm peak discharge was obtained by extrapolating a straight line through the 10-, 2-, and 1-percent-annual-chance storms peak discharges plotted on log-probability paper.

For Herndon Branch, peak discharges were incorporated from a LOMR issued October 13, 1994 (Reference 31).

For the Maxwell Creek Watershed south of Lucas Road (State Highway 1378), which includes Maxwell Creek, Bunny Run South Tributary and Bunny Run North Tributary, and McMillan Tributary, was subdivided into 15 subbasins, the downstream of which covers SCS Floodwater Retarding Reservoir No. 7 (Reference 31). Snyder's synthetic unit hydrographs were developed for these selected areas. Urbanization and imperviousness values were based on available aerial photography and site visits. Rainfall for each frequency storm was developed using data from NWS Technical Paper No. 40 (Reference 5) and NOAA Technical Memorandum Hydro-35 (Reference 6). Rainfall for the 0.2-percent-annual-chance storm was computed by extrapolation of data from these sources. Snyder's unit hydrographs were developed for each subbasin based on specific physical measurements. The measurements were taken from standard USGS 7.5-minute quadrangle maps (Reference 26). Unit-hydrograph lag times (Tps) were derived from each subbasin using methodology described in the following reports: "Synthetic Hydrograph Relationships, Trinity River Tributaries, Fort Worth-Dallas Urban Area" (Reference 29) and "Effects of Urbanization on Various Frequency Peak Discharges" (Reference 30).

Dublin Creek was modeled using the rational method (Reference 19). NWS Technical Paper No. 40 was used in developing the 10-, 2-, and 1-percent-annual-chance storms (Reference 5). The 0.2-percent-annual-chance storm peak discharges were determined by straight line extrapolation on log-probability paper. The decrease in peak discharge with an increase in drainage area for some streams is due to watershed shape and/or overbank storage effects.

For the unincorporated areas of Collin County that include Camp Creek, Cottonwood Creek-East Fork, the East Fork Trinity River, Franklin Branch, Maxwell Creek, Muddy Creek, Muddy Creek Tributary, Muddy Creek Tributary

1, Muddy Creek Tributary 2, Reid Branch, Rowlett Creek, Rowlett Creek Tributary, Rush Creek, Rush Creek Tributary, Rutherford Branch, Sabine Creek Tributary B, Sloan Creek, Stream 5B13, Stream 5B14, Unnamed Tributary to Wilson Creek, White Rock Creek, White Rock Creek East, and Wilson Creek (Reference 22) the flood-frequency discharge values were determined using the USACE HEC-1 computer program (Reference 15). The effect of SCS flood-control structures within the drainage basin of the study area and the resulting storage-discharge relationships were incorporated into the study. Unit hydrographs were derived based on a log-normal distribution and incorporated into a computer study as derived by James A Constant of the USACE. Fifteen-minute rainfall increments were used, since the drainage areas involved were small, causing short times to peak. Rainfall values were obtained from NWS Technical Paper No. 40 and NOAA Technical Memorandum NWS Hydro-35 (References 5 and 6). Lag times were based on a USACE report (Reference 23).

2009 Revised Analysis

In the 2009 revision, discharges for Cottonwood Creek No. 1, Doe Branch, East Fork Trinity River, Muddy Creek (Upper Reach), Rowlett Creek, Stewart Creek Tributary 4, Watters Branch, and West Rowlett Creek were based on new detailed analyses.

For the East Fork Trinity River, a flood frequency analysis was performed utilizing PeakFQ (Reference 32) to calculate the 10-, 2-, 1-, and 0.2-percent-annual-chance storms peak discharges. The analysis followed the standard hydrologic methods described in Bulletin 17B (Reference 33) utilizing gages located on the East Fork Trinity River. USGS Gage 8059000 with a period of record from 1955-1975 and USGS gage 8058900 with a period of record 1976-2002 were combined for the analysis to create a 48 year period of record. The peak discharge for the May 1982 event was included as a high outlier with a return period of approximately 360 years.

For the remaining streams, the hydrologic analyses of discharges were based on design storms computed using HEC-HMS computer program (Reference 34). The HEC-HMS computer program computes flood hydrographs using a unit hydrograph defined by the SCS method parameters. In order to use this program, the estimated SCS Curve Number, the lag time (tL), the storm rainfall, and drainage areas had to be defined as input parameters. The SCS Curve Number method, the SCS Unit Hydrograph Method and the Muskingum-Cunge 8-point method were used to determine the loss-rate, transform rainfall excess into surface runoff, and route the flow through the channel for steady-state simulations, respectively. Rainfall data were developed using NCTCOG Integrated Stormwater Policy Guidebook & Design Manual for Development/Redevelopment (Reference 35). The rainfall data obtained from the manual is based on the USGS Depth-Duration Frequency of Precipitation for Texas, Water Resource Investigations Report 98- 40441 (Reference 36)

Revised Analysis

In the current revision, discharges for Caruth Creek, Cedar Creek West, Fox Creek, Pittman Creek, Pittman Creek Tributary 2, Prairie Creek, Russell Creek, Spring Creek, Spring Creek Tributary 4, Stream 2H3, Stream 5B18, Stream

5B19, Stream 5B20, Stream 5B21, Stream 5B22, Stream 5B23, Stream 5B24, Stream 5B25, Stream 5B26, Stream 5B27, Stream 5B29, Stream 5B30, Stream 5B31, Stream 5B32, Stream 5B33, Stream 5B34, Stream 5B35, Stream 5B36, Stream 5B37, Warden Creek, White Rock Creek, White Rock Creek Tributary 1, White Rock Creek Tributary 2, and White Rock Creek Tributary 3 were based on new hydrologic analyses.

The hydrologic analyses of discharges for this study were based on design storms computed using HEC-HMS computer program. The HEC-HMS computer program computes flood hydrographs using a unit hydrograph defined by the SCS method parameters. The estimated SCS Curve Number, the lag time (t_p), drainage basin characteristics coefficient, the storm rainfall, and drainage areas were defined as input parameters. The SCS Curve Number method and the Snyder's Unit Hydrograph method were used to determine the loss-rate and to transform rainfall excess into surface runoff. The Modified Puls method was used to route the flow through the channel of the streams being studied. The Munking-Cunge method was used to route the flow through the streams which contribute to the study streams, but were not studied. Rainfall data was obtained from the NCTCOG Integrated Stormwater Policy Guidebook & Design Manual for Development/Redevelopment (Reference 35) and is based on the USGS Depth-Duration Frequency of Precipitation for Texas, Water Resource Investigations Report 98-40441.

A summary of the drainage area-peak discharge relationships for all the streams studied by detailed methods is shown in Table 8, "Summary of Discharges."

TABLE 3 – SUMMARY OF DISCHARGES

FLOODING SOURCE AND LOCATION	DRAINAGE AREA (sq. miles)	10-PERCENT	PEAK DISCHARGES (cfs)		
			2-PERCENT	1-PERCENT	0.2-PERCENT
BECK BRANCH					
At confluence with Rowlett Creek	4.12	5,300	7,500	8,400	10,700
At point approximately 0.4 mile above North Star Road	2.31	4,000	5,500	6,200	7,800
At a point approximately 500 feet above Shiloh Road	1.22	2,800	3,850	4,300	5,300
BOIS D'ARC CREEK					
At confluence with Sabine Creek*	28.5	13,455	20,930	24,250	33,000
At confluence with Sabine Creek**	11.1	6,200	9,310	10,640	14,100
Immediately downstream of Josephine Street	9.9	5,735	8,615	9,835	13,100
BOWMAN BRANCH					
At confluence with Brown Branch	1.54	2,200	3,100	3,500	4,900
At U.S. Route 75	0.94	1,400	1,900	2,500	4,000
BROWN BRANCH					
At confluence with Rowlett Creek	4.43	5,800	7,900	8,900	11,400
Above Bowman Ranch	1.51	2,500	3,400	3,800	4,900
At U.S. Route 75	1.04	1,700	2,300	2,600	3,400
BUNNY RUN NORTH TRIBUTARY					
At confluence with Bunny Run South Tributary	0.36	870	1,140	1,260	1,540

* Confluence of Bois d'Arc Creek; due to existing hydraulic conditions and topography, coincident flows were used for the lower reach of Bois d'Arc Creek

** Confluence of Bois d'Arc Creek with Sabine Creek; flow reflects actual Bois d'Arc Creek contribution

TABLE 3 – SUMMARY OF DISCHARGES (Cont'd)

FLOODING SOURCE AND LOCATION	DRAINAGE AREA (sq. miles)	10-PERCENT	PEAK DISCHARGES (cfs)		
			2-PERCENT	1-PERCENT	0.2-PERCENT
BUNNY RUN NORTH TRIBUTARY (Cont'd)

3.2 Hydraulic Analyses

Analyses of the hydraulic characteristics of flooding from the source studied were carried out to provide estimates of the elevations of floods of the selected recurrence intervals. Users should be aware that flood elevations shown on the FIRM represent rounded whole-foot elevations and may not exactly reflect the elevations shown on the Flood Profiles or in Table 5, Floodway Data in the FIS report. For construction and/or floodplain management purposes, users are encouraged to use the flood elevation data presented in this FIS in conjunction with the data shown on the FIRM.

Cross sections were determined from topographic maps and field surveys. All bridges, dams, and culverts were field surveyed to obtain elevation data and structural geometry. All topographic mapping used to determine cross sections are referenced in Section 4.1.

Locations of selected cross sections used in the hydraulic analyses are shown on the Flood Profiles (Exhibit 1). For stream segments for which a floodway was computed (Section 4.2), selected cross section locations are also shown on the FIRM (Exhibit 2).

The hydraulic analyses for this FIS were based on unobstructed flow. The flood elevations shown on the profiles are thus considered valid only if hydraulic structures remain unobstructed, operate properly, and do not fail.

Initial Countywide and Previous Studies

For each community within Collin County that has a previously printed FIS report, the hydraulic analyses described in those reports have been compiled and are summarized below.

Information on the methods used to determine water-surface elevations for the streams studied by detailed methods, compiled from the previously-printed narratives for Collin County, is shown below. Except where noted, water-surface elevations for floods of the selected recurrence intervals were determined using the USACE HEC-2 step-backwater compute program (Reference 25). The incorporated communities and the unincorporated areas of the county are listed in alphabetical order; methodologies used to develop cross sections, starting water-surface elevations, and channel roughness factors (Manning's "n") are described for each community. For streams that flow through two or more communities, each methodology described applies only to that portion of the stream studied by detailed methods within that particular community. The listing of streams considered in each FIS includes only those streams or portions of streams whose hydraulic analyses were taken from that particular study. For all restudied and/or revised streams, the hydraulic methodologies used for the restudies/revisions were the same as those used in the original analyses of those streams.

The FIS for the City of Allen considered the following streams: Cottonwood Creek No. 1 (formerly Cottonwood Creek), Mustang Creek, Rowlett Creek, Russell Creek, Stream 2D15, Stream 2D16, Stream 2F1, Stream 2G2, Stream 2G3, Stream 2G5, Unnamed Tributary to Watters Branch, Watters Branch, and West Rowlett Creek (Reference 3).

In that study, cross section data were compiled from several sources. Bridge data were obtained by field measurements and from local, county, and State Department of Highways and Public Transportation bridge plans. USGS topographic maps were used whenever necessary to extend cross sections to contain flow (Reference 26). Supplemental field surveys were obtained by the USACE for several streams in December 1986. Additional surveyed cross sections were supplied by Albert H. Halff Associates.

Starting water-surface elevations for Rowlett Creek were obtained from the FIS for the City of Plano (Reference 20). Starting elevations for Cottonwood Creek No. 1, Mustang Creek, Russell Creek, Stream 2G2, Stream 2G3, Watters Branch, West Rowlett Creek, and Stream 2G5 were based on slope/area computations. Starting elevations for 2D15, 2D16, and 2F1 were based on coincident condition elevations from the larger streams.

Channel roughness factors (Manning's "n") for the hydraulic computations were assigned on the basis of field inspections of floodplain areas, engineering judgment, and on previous studies by the USACE.

The FIS for the City of Celina considered Doe Branch (Reference 8). In that study, cross sections were field surveyed and located at close intervals above or below bridges and culverts in order to compute the significant backwater effects of those structures. Starting water-surface elevations were determined using the slope/area method. Channel roughness factors were assigned on the basis of field inspections of the floodplain areas.

The FIS for the Town of Fairview considered Sloan Creek and Wilson Creek (Reference 10). In that study, cross section data were obtained by field survey. All bridges and culverts were field surveyed to obtain elevation data and structural geometry. Cross sections were located at close intervals above and

below bridges and culverts in order to compute significant backwater effects. Starting water-surface elevations were determined using the slope/area method. Channel roughness factors were assigned on the basis of field inspection of the floodplain areas.

The FIS for the City of Frisco considered the following streams: Cottonwood Branch, North Branch Stewart Creek Tributary 1, Panther Creek, Panther Creek Tributary 1, Rowlett Creek, Rowlett Creek Tributary, Stewart Creek, Stewart Creek Tributary 1, Stewart Creek Tributary 2, Stewart Creek Tributary 3, Stewart Creek Tributary 4, Tributary A of Stewart Creek, Tributary WRC-1 of West Rowlett Creek, Unnamed Tributary to White Rock Creek, West Rowlett Creek, and White Rock Creek (Reference 12). Hydraulic analyses for Stream SC-1, which is also located within the City of Frisco, were taken from the FIS for the City of the Colony (Reference 13). Hydraulic analyses used in that study were the same as those used for the streams included in the FIS for the City of Frisco.

In the FIS for the City of Frisco, cross sections were field surveyed and located at close intervals above and below bridges and culverts in order to computer their significant backwater effects. All bridges and culverts were field surveyed to obtain elevation data and structural geometry.

Water-surface elevations for the upper portion of Stewart Creek were computed using the SCS WSP-2 computer program (Reference 27); starting elevations for the upper portion of Stewart Creek were obtained from the upstream limit of detailed study on the lower portion of Stewart Creek. For the remaining steams, starting elevations were determined using the slope/area method. Channel roughness factors were assigned on the basis of engineering judgment and field inspection of the floodplain areas.

The FIS for the City of Josephine considered Sabine Creek Tributary B (Reference 28). In that study, cross sections were field surveyed and located at close intervals above or below bridges and culverts in order to compute the significant backwater effects of those structures. Starting water-surface elevations were obtained by the slope/area method. Channel roughness factors were estimated based on field inspections of the floodplain areas.

The FIS for the City of McKinney considered the following streams: the East Fork Trinity River, Wilson Creek, Jeans Creek, Unnamed Tributary to Wilson Creek, and Franklin Branch (Reference 11). Quail Creek Channel B is also located in the City of McKinney; hydraulic analyses prepared as part of this revision for that stream are the same as those prepared for streams included in the FIS for the City of McKinney.

In that study, cross section data were obtained by field surveys. Bridges and culverts were surveyed to obtain elevation data and structural geometry. The hydraulic models for the East Fork Trinity River, Wilson Creek, and Jeans Creek were obtained from the Fort Worth District of the USACE, Flood Plain Management Services Branch (Reference 16). Channel roughness factors were assigned on the basis of field inspection at each cross section location. For concrete and metal culverts, “n” values were taken from tables in hydraulic texts.

The FIS for the City of Murphy considered Maxwell Creek (Reference 18) and Bunny Run South and North Tributaries and McMillan Tributary in a subsequent

revision. In that study, cross section data were obtained by field surveys. All bridges and culverts were field surveyed to obtain elevation data and structural geometry. Cross sections were located at close intervals above and below bridges and culverts in order to compute their significant backwater effects. Starting elevations were determined by routing the flood hydrographs through the SCS flood retention basin located downstream of the City of Murphy. Channel roughness factors were assigned on the basis of field inspection and previous studies by the USACE.

The FIS for the City of Parker considered Maxwell Creek, Cottonwood Creek, and Dublin Creek (Reference 19). In that study, cross sections were field surveyed and located at close intervals above or below bridges and culverts in order to compute their significant backwater effects. Starting elevations for Maxwell Creek were taken from the stage discharges of the lake at the mouth of the creek. Starting elevations for Cottonwood Creek were based on coincident conditions with Rowlett Creek. Starting elevations for Dublin Creek were determined using the slope/area method. Channel roughness factors were assigned on the basis of field inspections of the floodplain areas and previous studies by the USACE.

The FIS for the City of Plano considered the following streams: Brown Branch, Bowman Branch, Rowlett Creek, Russell Creek, Spring Creek, Cottonwood Creek No. 1 (formerly Cottonwood Creek), Beck Branch, Pittman Creek, North Fork Pittman Creek, Prairie Creek, McKamy Branch, White Rock Creek, Unnamed Tributary to Rowlett Creek, Streams 2D8-2D12, 2D15, 2H3, 2I9, 2I11, 2I12, 2L1, 5B13, Tributary to Stream 5B13, and Streams 5B14 and 5B18-5B37 (Reference 20). Stream IC-1 and Stream IC-1A are also located in the City of Plano; hydraulic analyses prepared as part of this revision for these streams are the same as those prepared for the streams included in the FIS for the City of Plano. The hydraulic analyses for Indian Creek, which is also located within the City of Plano, were taken from the FIS for the Unincorporated Areas of Denton County (Reference 21). In the FIS for the City of Plano, cross section data were compiled from several sources. Bridge data were obtained by field measurements and from City of Plano, Collin County, and State Department of Highways and Public Transportation bridge plans. USGS topographic maps were used when necessary to extend the cross sections to contain flow. Supplemental field surveys were obtained by the USACE for several streams. Additional surveyed cross sections to contain flow. Supplemental field surveys were obtained by the USACE for several streams. Additional surveyed cross sections were supplied by Albert H. Halff Associates. Aerial mapping by the City of Plano was obtained on the White Rock Creek and Indian Creek Watersheds. This 2-foot contour interval mapping was used for hydraulic cross sections on the streams in those watersheds.

Starting elevations for Rowlett Creek were based on Lake Ray Hubbard flood elevations. Starting elevations for White Rock Creek were based on a backwater model for the downstream portion of the creek. For the remaining streams, starting elevations were determined using the slope/area method.

Channel roughness factors were assigned on the basis of field inspections of the floodplain areas, engineering judgment, and previous studies by the USACE.

The FIS for the Unincorporated Areas of Collin County considered the following streams: Camp Creek, Cottonwood Creek-East Fork and the East Fork Trinity River, Franklin Branch, Maxwell Creek, Muddy Creek, Muddy Creek Tributary, Muddy Creek Tributary 1, Muddy Creek Tributary 2, Reid Branch, Rowlett Creek, Rowlett Creek Tributary, Rush Creek, Rush Creek Tributary, Rutherford Branch, Sabine Creek Tributary B, Sloan Creek, Stream 5B13, Stream 5B14, Unnamed Tributary to Wilson Creek, White Rock Creek, and Wilson Creek (Reference 22).

In that study, cross sections were field surveyed and located at close intervals above or below bridges and culverts in order to compute their significant backwater effects. All bridges and culverts were field checked to obtain elevation data and structural geometry. Starting elevations were determined using the slope/area method. Channel roughness factors were assigned on the basis of field inspections of the floodplain areas.

The FIS for the City of Wylie considered the following streams: Muddy Creek, Muddy Creek Tributary, Muddy Creek Tributary 1, Rush Creek, Rush Creek Tributary (Reference 24), Unnamed Tributary to Muddy Creek, and Unnamed Tributary to an Unnamed Tributary to Muddy Creek.

In that study, cross sections were field surveyed and located at close intervals above and below bridges and culverts in order to compute their significant backwater effects. All bridges, dams and culverts were surveyed to obtain elevation data and structural geometry. Starting elevations were determined using the slope/area method. Channel roughness factors were assigned on the basis of engineering judgment and field inspections of the channel and floodplain areas.

2009 Revised Analysis

Information on the methods used to determine peak discharge-frequency relationships for the streams restudied as part of the 2009 countywide FIS is shown below.

Cross sections for the hydraulic model were developed using GIS-based automated modeling techniques from a digital terrain model of the study area. The floodplain digital terrain model was developed from aerial photogrammetric topographic survey of the above water areas and bathymetric transect survey of the underwater areas. Dimensions of the hydraulic structures were determined from available plan information and from field surveys.

Roughness factors (Manning's "n") used in the hydraulic computations were chosen by engineering judgment and were based on field observations, analysis of photographs, professional experience, and previous analyses by other agencies.

Water-surface elevations of the selected recurrence intervals were determined using a steady flow step-backwater hydraulic model, HEC-RAS version 3.1.2. Starting water-surface elevations for Cottonwood Creek No. 1, East Fork Trinity River, Muddy Creek and Rowlett Creek were based on backwater models for downstream portion of the creeks. For Doe Branch, Watters Branch and West Rowlett Branch, the starting water surface elevation was based on normal depth

calculations. For Stewart Creek Tributary 4, the starting water surface elevation was based on LOMR 98-06-1035P.

Revised Analysis

Information on the methods used to determine peak discharge-frequency relationships for the streams restudied as part of this countywide FIS is shown below.

Cross-section geometries were obtained from a combination of digital terrain data, developed based on the topographic data obtained from Texas Natural Resources Information System and North Central Texas Council of Governments, and field surveys. Elevation data and structural geometry for all bridges, dams, inline structures, and culverts were based on field surveys or as-built data provided by the City of Plano and the Texas Department of Transportation. Additional cross-sections were field surveyed along the streams to determine channel geometries between bridges and culverts, and were placed along the stream to account for significant profile inflection points (profile breaks). Cross-sections at profile breaks are critical for accuracy in the development of 10-, 2-, 1- and 0.2 -percent-annual-chance flood elevations and floodways.

Roughness factors (Manning's "n") for this study were estimated from the aerial photography and field survey information. A Manning's "n" value was assigned to each land use type. Manning's n values were then extracted for each cross-section and imported into HEC-RAS models. For many of the studies in urban areas, the channels were found to be overgrown with tall vegetation while areas in the overbanks were well maintained short grasses or paved surfaces. This has resulted in higher roughness coefficients assigned to the channel for these areas.

For these detailed study streams, the water surface elevations for the 10-, 2-, 1- and 0.2- percent annual chance flood elevations were computed using the USACE HEC-RAS 4.0.0 step backwater computer program. The hydraulic analyses for this study used a steady-state riverine analysis and also included cross-sections and field data collected during detailed field surveys. For the hydraulic simulations, all structures were assumed to remain fully functional and have unobstructed flows.

The downstream boundary conditions for the stream reaches that are not continuous with other reaches along the same stream were determined using a normal depth method. For Prairie Creek, Spring Creek, and White Rock Creek, the downstream boundary conditions were set at a known water surface elevations as these streams were continuous with the existing detailed studies downstream.

Flood profiles were drawn showing computed water-surface elevations for floods of the selected recurrence intervals.

Roughness factors (Manning's "n") used in the hydraulic computations were chosen by engineering judgment and were based on field observations of the

streams and floodplain areas. Roughness factors for all streams studied by detailed methods are shown in Table 4, "Manning's "n" Values."

*Data not available

3.3 Vertical Datum

All FIS reports and FIRMs are referenced to a specific vertical datum. The vertical datum provides a starting point against which flood, ground, and structure elevations can be referenced and compared. Until recently, the standard vertical datum used for newly created or revised FIS reports and FIRMs was the National Geodetic Vertical Datum of 1929 (NGVD 29). With the completion of the North American Vertical Datum of 1988 (NAVD 88), many FIS reports and FIRMs are now prepared using NAVD 88 as the referenced vertical datum.

Flood elevations shown in this FIS report and on the FIRM are referenced to the NAVD 88. These flood elevations must be compared to structure and ground elevations referenced to the same vertical datum. Some of the data used in this revision were taken from the prior effective FIS reports and FIRMs and adjusted to NAVD 88. The datum conversion factor from NGVD 29 to NAVD 88 in Collin County is 0.06 feet.

For additional information regarding conversion between the NGVD 29 and NAVD 88, visit the National Geodetic Survey website at www.ngs.noaa.gov, or contact the National Geodetic Survey at the following address:

Silver Spring, MD 20910-3282

Temporary vertical monuments are often established during the preparation of a flood hazard analysis for the purpose of establishing local vertical control. Although these monuments are not shown on the FIRM, they may be found in the Technical Support Data Notebook associated with the FIS report and FIRM for this community. Interested individuals may contact FEMA to access these data.

To obtain current elevation, description, and/or location information for benchmarks shown on this map, please contact the Information Services Branch of the NGS at (301) 713-3242, or visit their website at www.ngs.noaa.gov.

4.0 **FLOODPLAIN MANAGEMENT APPLICATIONS**

The NFIP encourages State and local governments to adopt sound floodplain management programs. To assist in this endeavor, each FIS provides 1-percent annual chance floodplain data, which may include a combination of the following: 10-, 2-, 1-, and 0.2-percent annual chance flood elevations; delineations of the 1- and 0.2-percent annual chance floodplains; and 1-percent annual chance floodway. This information is presented on the FIRM and in many components of the FIS, including Flood Profiles, Floodway Data tables, and Summary of Stillwater Elevation tables. Users should reference the data presented in the FIS as well as additional information that may be available at the local community map repository before making flood elevation and/or floodplain boundary determinations.

4.1 Floodplain Boundaries

To provide a national standard without regional discrimination, the 1 percent annual chance (100-year) flood has been adopted by FEMA as the base flood for floodplain management purposes. The 0.2 percent annual chance (500-year) flood is employed to indicate additional areas of flood risk in the community. For the streams studied in detail, the 100- and 500-year floodplain boundaries have been delineated using the flood elevations determined at each cross section. Between cross sections, the boundaries were interpolated using topographic maps. Within the City of McKinney, boundaries for Wilson Creek and Jeans Creek were interpolated using topographic maps at a scale of 1:9,600, and boundaries for an unnamed stream near Bois D'Arc Road were delineated using site grading plans at a scale of 1:1,200 (References 30 and 31). For the remaining flooding sources within Collin County from previous studies, boundaries were interpolated using topographic maps at a scale of 1:24,000 with a contour interval of 10 feet (Reference 26). For the 2009 countywide FIS, the floodplain boundaries between cross sections were interpolated using topographic maps at scales of 1:6,000 with a contour interval of 2 feet (Reference 37).

For this countywide revision, the floodplain boundaries in between cross sections were interpolated using topographic data developed by FEMA in conjunction with the North Central Texas Council of Governments (NCTCOG) and Texas Water Development Board (TWDB). Light Detection And Ranging (LiDAR) data which was collected in 2009 was obtained from TWDB and photogrammetric data from the NCTCOG was used in areas not covered by the LiDAR data.

For the flooding sources studied by approximate methods, the boundaries of the 1-percent annual chance floodplains were interpolated using topographic maps at a scale of 1:6,000 and a contour interval of 2-feet (Reference 37).

The 1- and 0.2-percent annual chance floodplain boundaries are shown on the FIRM (Exhibit 2). On this map, the 1-percent annual chance floodplain boundary corresponds to the boundary of the areas of special flood hazards (Zones A and AE), and the 0.2-percent annual chance floodplain boundary corresponds to the boundary of areas of moderate flood hazards. In cases where the 1- and 0.2-percent annual chance floodplain boundaries are close together, only the 1-percent annual chance floodplain boundary has been shown. Small areas within the floodplain boundaries may lie above the flood elevations but cannot be shown due to limitations of the map scale and/or lack of detailed topographic data.

For the streams studied by approximate methods, only the 1-percent annual chance floodplain boundary is shown on the FIRM (Exhibit 2).

4.2 Floodways

Encroachment on floodplains, such as structures and fill, reduces flood-carrying capacity, increases flood heights and velocities, and increases flood hazards in areas beyond the encroachment itself. One aspect of floodplain management involves balancing the economic gain from floodplain development against the resulting increase in flood hazard. For purposes of the NFIP, a floodway is used as a tool to assist local communities in this aspect of floodplain management.

Under this concept, the area of the 1-percent annual chance floodplain is divided into a floodway and a floodway fringe. The floodway is the channel of a stream, plus any adjacent floodplain areas, that must be kept free of encroachment so that the 1-percent annual chance flood can be carried without substantial increases in flood heights. Minimum federal standards limit such increases to 1.0 foot, provided that hazardous velocities are not produced. The floodways in this FIS are presented to local agencies as minimum standards that can be adopted directly or that can be used as a basis for additional floodway studies.

The floodways presented in this FIS were computed for certain stream segments on the basis of equal conveyance reduction from each side of the floodplain. Floodway widths were computed at cross sections. Between cross sections, the floodway boundaries were interpolated. The results of the floodway computations are tabulated for selected cross sections (Table 5). The computed floodways are shown on the FIRM (Exhibit 2). In cases where the floodway and 1-percent annual chance floodplain boundaries are either close together or collinear, only the floodway boundary is shown.

Portions of the floodways for Bois d' Arc Creek, Camp Creek, Cottonwood Branch, Cottonwood Creek, Pond Branch, Prairie Creek, Rowlett Creek, Sabine Creek, Spring Creek, Stewart Creek, Stewart Creek Tributary 1, Stewart Creek Tributary 3, Stream 2E7, Stream IC-1, Stream IC-1A extend beyond the county boundary covered in this study. No floodways were computed for Cottonwood Creek – East Fork, Franklin Branch, Hall Branch, Long Branch, North Branch Stewart Creek Tributary 1, Osage Branch, Reid Branch, Rowlett Creek Tributary, Rutherford Branch, Stream I5.5, Stream 5B15, Stream 5B16, Stream 5B17, Tributary A to Stewart Creek, Tributary WRC-1 West Rowlett Creek, Unnamed Tributary to Muddy Creek, Unnamed Tributary to an Unnamed Tributary to Muddy Creek, Unnamed Tributary to Rowlett Creek, Unnamed Tributary to Watters Branch, Unnamed Tributary to White Rock Creek., West Rowlett Creek Tributary 1, Wilson Creek Tributary 8, and Wilson Creek Tributary 9.

Near the mouths of stream studied in detail, floodway computations are made without regard to flood elevations on the receiving water body. Therefore, "Without Floodway" elevations presented in Table 5 for certain downstream cross sections are lower than regulatory flood elevations in that area, which must take into account the 100-year flooding due to backwater from other sources.

Encroachment into areas subject to inundation by floodwaters having hazardous velocities aggravates the risk of flood damage, and heightens potential flood hazards by further increasing velocities. A listing of stream velocities at selected cross sections is provided in Table 5, "Floodway Data." In order to reduce the risk of property damage in areas where the stream velocities are high, the community may wish to restrict development in areas outside the floodway.

TABLE 5	FEDERAL EMERGENCY MANAGEMENT AGENCY	FLOODWAY DATA
	COLLIN COUNTY, TX AND INCORPORATED AREAS	WILSON CREEK

The area between the floodway and 1-percent annual-chance-floodplain boundaries is termed the floodway fringe. The floodway fringe encompasses the portion of the floodplain that could be completely obstructed without increasing the water-surface elevation of the 1-percent-annual-chance flood by more than 1.0 foot at any point. Typical relationships between the floodway and the floodway fringe and their significance to floodplain development are shown in Figure 1.

Figure 1 - Floodway Schematic

5.0 INSURANCE APPLICATIONS

For flood insurance rating purposes, flood insurance zone designations are assigned to a community based on the results of the engineering analyses. The zones are as follows:

Zone A

Zone A is the flood insurance rate zone that corresponds to the 1-percent annual chance floodplains that are determined in the FIS by approximate methods. Because detailed hydraulic analyses are not performed for such areas, no base flood elevations or depths are shown within this zone.

Zone AE

Zone AE is the flood insurance rate zone that corresponds to the 1-percent annual chance floodplains that are determined in the FIS by detailed methods. In most instances, whole-foot base flood elevations derived from the detailed hydraulic analyses are shown at selected intervals within this zone.

Zone X

Zone X is the flood insurance rate zone that corresponds to areas outside the 0.2- percent annual chance floodplain, areas within the 0.2-percent annual chance floodplain, and to areas of 1-percent annual chance flooding where average depths are less than 1 foot, areas of 1-percent annual chance flooding where the contributing drainage area is less than 1 square mile, and areas protected from the 1- percent annual chance flood by levees. No base flood elevations or depths are shown within this zone.

6.0 FLOOD INSURANCE RATE MAP

The FIRM is designed for flood insurance and floodplain management applications.

For flood insurance applications, the map designates flood insurance rate zones as described in Section 5.0 and, in the 1-percent annual chance floodplains that were studied by detailed methods, shows selected whole-foot base flood elevations or average depths. Insurance agents use the zones and base flood elevations in conjunction with information on structures and their contents to assign premium rates for flood insurance policies.

For floodplain management applications, the map shows by tints, screens, and symbols, the 1- and 0.2-percent annual chance floodplains. Floodways and the locations of selected cross sections used in the hydraulic analyses and floodway computations are shown where applicable.

The current FIRM presents flooding information for the entire geographic area of Collin County. Previously, separate Flood Hazard Boundary Maps and/or FIRMs were prepared for each identified flood-prone incorporated community and the unincorporated areas of the county. This countywide FIRM also includes flood hazard information that was presented separately on Flood Boundary and Floodway Maps (FBFMs), where applicable. Historical data relating to the maps prepared for each community, up to and including this countywide FIS, are presented in Table 6, "Community Map History."

7.0 OTHER STUDIES

FISs have been completed for Denton and Rockwall Counties and is currently being prepared for Dallas County. The results of these studies will be in general agreement with the results of this study.

This is a multi-volume FIS. Each volume may be revised separately, in which case it supersedes the previously printed volume. Users should refer to the Table of Contents in Volume 1 for the current date of each volume; volumes bearing these dates contain the most up-to-date flood hazard data.

This FIS report either supersedes or is compatible with all previous studies published on streams studied in this report and should be considered authoritative for the purposes of the NFIP.

8.0 LOCATION OF DATA

Information concerning the pertinent data used in the preparation of this study can be obtained by contacting FEMA Region VI, Federal Regional and Mitigation Division, 800 North Loop 288, Denton, Texas 76209.
